YAMAHA OUTBOARDS
Works on these models: 115–350 hp SHO, Carb. VMax, 2-stroke, 4-stroke, HPDI and Saltwater Series with 3-RAM Trim/Tilt Systems. (V8 models need 2 m-y wedge units.)

SUZUKI OUTBOARD
Works on this model: DF90 hp – DF300 hp 4-Stroke with 3-RAM Trim/Tilt Systems

Install on Port Side of Yamaha Outboards.

1. Trim outboard to up position.
2. Simply slide m-y wedge on port side over Trim/Tilt piston of lower unit.
3. m-y wedge will position and self-center, slide completely down.
4. Trim outboard down until the rubber begins to compress and motor is secure.
5. To remove m-y wedge simply trim outboard to up position and remove.
6. Store m-y wedge in any boat compartment for convenience.

Note: We recommend that you rotate m-y wedge 1/4 to 1/2 turn each use. This helps even the compression of the EPDM Rubber on the unit.

Lower until starboard piston retracts 1/4” to 1/2” to secure.
Correct trailering height shown.
No need to hold on to anything!
